From the Director

Welcome to the 2006 edition of our Annual Report!

The last few years have been very successful for the Institute practically in all the fields of its activity – the staff advancement and promotion, research projects as well as in teaching and building of the laboratory infrastructure. The main areas of research and development, in which the Institute has noted significant progress include: radiocommunications and radionavigations, multimedia techniques as well as biomedical engineering.

The Institute of Radioelectronics can pride itself on over 35 years of its existence and tradition which dates back to the early years of the previous century. Currently, the Institute of Radioelectronics is the biggest of all the six institutes at the Faculty of Electronics and Information Technologies. It employs 68 scientific and didactic workers, therein 15 Professors (9 with the state title), 45 Assistant Professors as well as 24 members of technical and administrative staff. There are almost 50 Ph.D. students under the guardianship of the Institute.

Last year may be recognized as the one which concludes a certain phase of transformation into the direction of the international market. For the first time, the value of the research and development works, realized within the framework of the EU projects, has considerably exceeded the value of the domestic works. Secondly, a great deal of research teams have found themselves among the world leaders in their disciplines. Thirdly, the Institute boasted a lot of major publications on various areas.

The past year was marked with the impressive number of international projects and co-operations. What is particularly pleasing, is the fact of realization of as many as five STREP projects (*specific targeted research projects*) as well as a few others, such as networks of excellence. The largest is CODMUCA (*Core Subsystem for Delivery of MultiBand Data in CATV Networks*), in which the Institute plays a leading role. Moreover, the Institute has, for many years, been taking pride in a successful cooperation with one of the most world-famous physics laboratories – CERN. We have also managed to sign contracts for the realization of research projects with the world's leading companies, e.g. Mitsubishi, Whirlpool.

Our Institute has also been a co-organizer of a few important conferences. The particularly far-reaching and successful one is MIKON – International Conference on Microwaves, Radar and Wireless Communications. The number of its foreign participants has been steadily increasing over the years and the Conference has already gained the status of a well-known and leading event in Central Europe. Last year the Conference was held in Cracow, with 278 papers from 37 countries. Special weight should also be given to other conferences, such as PROCTOM and COMPASS-CERN.

All the achievements that we were able to attain in the previous year, ought to be attributed to our excellent highly-motivated staff. Currently, most of our Professors, are universally recognized as authorities in their domains, among which one can mention electromagnetic simulation, intelligent multimedia systems, smart antennas, signal theory and signal processing as well as the design of the apparatus for the experiments in high energy physics. Moreover, many of them have recently taken up appreciable positions in the world of science – they have become leaders of the world-famous conferences, professional associations as well as scientific projects. Apart from the above-mentioned details regarding our current and senior staff, it is worth paying special attention to the young crew and their scientific achievements. The past year will be remembered as the year of nine successful Ph.D. dissertations defenses and many which are currently in their finishing phases as well as one habilitation. It is the Institute's long lasting tradition that annually a good deal

of Ph.D. dissertations is produced, nevertheless, this year ought to be rated as exceptionally successful in this matter. Moreover, most of these works are characterized by their strictly applicable contents. Such a trend gives a fair promise that next years will prove to be even more productive. Furthermore, a great deal of scientific notabilities have emerged from among our young assistant professors, who engage themselves in carrying out of various European projects. What is also worth mentioning, is the fact that several members of our young staff have received special awards for the best Ph.D. dissertations or for the outstanding papers.

The second element which, beside our splendid staff, contributed to our attainments is our laboratory base. There are over 20 laboratories, which constitute very good grounds for education of the future specialists as well as the realization of domestic and international projects. Most of them are equipped with the state-of-the-art apparatus. The unique on a national scale are: acoustic anechoic chamber, mobile radiocommunication laboratory (with PicoNode system), antenna anechoic chamber (with equipment up to 50 GHz) or tomography laboratory (with MRI, CT and impedance tomographs).

More detailed information on the history, tradition and the current picture of the Institute can be found in the newly published *35 years of the Institute of Radioelectronics* as well as in the previous issues of *Annual Reports*. Therefore, I strongly encourage all the colleagues interested in our unit to refer to the above-mentioned publications.

Last but not least, we would also like to express tremendous gratitude to our Grantors, Sponsors as well as all the Co-operators and Friends of the Institute, without whom we would have not been able to achieve our aims. On the one hand, Polish science is suffering from chronic underfunding and on the other, one can observe an insufficient movement in Polish industry. But despite the difficult situation and unfavorable conditions, it was the good will of those people who still have confidence in the development of Polish science, that made our goals more easily attainable.

1 GENERAL INFORMATION

1.1 Mission of the Institute

In defining its mission, the Institute of Radioelectronics is amenable to contemporary needs of academia, industry, and society. Therefore, it aims at the three measurable objectives: to provide teaching of societal relevance; to seek excellence in scientific research; and to run projects meeting the international standards. Technically, we focus on the three well-defined specializations: radiocommunications, multimedia, and biomedical engineering. These are very well perceived by our students and partners in national and international activities.

As educators, our staff performs sterling work and exhibit immense stamina. The effects are directly measurable in terms of quality and numbers of supervised diplomas. Our graduates prove competitive on the demanding job market in Poland and abroad. They find employment in telecommunication services, mobile communications, information technology, television, and also in public services. We reach further into these sectors through the successful scheme of continuing education. The offer of courses including Radiocommunications and Multimedia Technologies attracts an increasing number of participants.

As researchers, we are faithful to the highest standards of the Faculty and the University. We also feel quite unique due to an extremely broad spectrum of addressed subjects, which comprise:

- electromagnetic and acoustic field theory, acoustic and electromagnetic wave generation and propagation,
- signal theory, processing, coding, transmission, with regard to electronic, electroacoustic, and TV signals,
- radio transmitting and receiving,
- radiocommunication terrestrial and satellite systems,
- physical phenomena in radio engineering, acoustic, nuclear engineering, and medical systems,
- biomedical signal analysis, medical imaging, medical informatics,
- X-ray, MR, and emission tomography,
- detection and spectrometry of radiation,
- analysis and synthesis of electronic systems,
- intelligent multimedia systems and multimedia converged (video, data, and voice),
- measuring methods and systems,
- analysis, measurement, and estimation of sound and image distortion.

It is also our ambition to implement the new scientific knowledge into a good engineering practice. The Institute covers the full process of technological development, from innovative ideas up to the construction of prototypes. The products are applicable in: radio communication systems, radio-location antennae, television equipment, radio-monitoring systems, high-efficiency energy sources, high-power radio engineering devices, equipment for time and frequency services, biomedical instrumentation, measurement systems involving industry, nuclear engineering for scientific research, medicine, and food industry.

The Foundation for Development of Radiocommunications and Multimedia Technologies plays a special role in perpetuating scientific research within our Institute and the whole Faculty. The Foundation subsidizes undergraduate and graduate scholarships. It monitors and awards the progress of young Polish researchers. Its generous support helps us face the socio-economical obstacles, and compete with commercial opportunities awaiting the young people on the open market.

3.3 International co-operation

[Edu150] **SOCRATES Program: Higher Education**
T. Kosiło, T. Buczkowski
1999 – 2006

Within the framework of SOCRATES Institutional Contract two bilateral programs were realized: first – between the Institute of Radioelectronics of the Warsaw University of Technology and Katholieke Hogeschool Sint-Lieven, Gent, Belgium; second – between the Institute of Radioelectronics of the Warsaw University of Technology and Instituto Superior Tecnico, Universidade Tecnica de Lisboa, Lisbon, Portugal. In both cases, Student Mobility actions were realized within the framework of Electronics and Telecommunication Engineering (Socrates code 06.05). The aim of the program is to realize a student project at the partner University. The Student Mobility program was as follows: Poland – Portugal; two students for 6 months (Michał Jakub Kościelak, Piotr Furtak). In the Institute of Radioelectronics, two students from Belgium – Ludo Stichelmeyer and Steven de Craene have realized the B.Sc. project in the Nuclear and Medical Electronics Division (de Barco/Bachelor-prijs award from Katholieke Hogeschool Sint-Lieven, Gent, Belgium).

4 RESEARCH ACTIVITIES

4.1 International projects

- [Pro1] **Co-operative Systems for Road Safety "Smart Vehicles on Smart Road".**
Tomasz Kosiło, J. Modelska, J. Kołakowski, S. Maszczyk, Z. Walczak; Jan. 1, 2006 – Dec. 31, 2009
SAFESPORT, EU Integrated Project (Partially funded by MSHE)

The key aspect of the project is to expand the time horizon for acquiring information relevant for safe driving, as well as to improve the precision, the reliability and the quality of the driver information, and to introduce new information sources. The time horizon of the SAFESPORT applications will allow an extension of the "Safety margin", namely the time in which a potential accident is detected before it can occur, from the range of "milliseconds" up to "seconds". This extension, called "green area" will reduce the risk of the accident to happen as more time will be given to drivers to realize that there is a potential danger, and to undertake the appropriate manoeuvres.

ACE2, EU Network of Excellence (Partially funded by MSHE)

ACE2 is focused on the IST strategic objectives „Mobile and Wireless Systems beyond 3G” and „Broadband for All” which in future wireless word will converge and antennas will be ubiquitous in very advanced forms. Antennas may therefore be the most important enabling technology for the future wireless system and network development. Adaptive array antennas will be required by some future systems and small very efficient antennas by others. The small antennas, mounted on every electronic equipment, on the body or in the body for medical implant communications, for example, must be carefully designed, so special software programs and test beds must be developed. All antenna to-day problems lay in particular interest of ACE2. Institute of Radioelectronics (IR) is involved in Work Packages concerned with near-field measurement techniques and dissemination of the results at academic and research level. In particular there are investigations of different measurement procedures for specific antenna quantities. The participation in the project reflects long term activity of the IR in European Antenna Community.

The project concerns the use of modern IT technologies in metrology. Main objects of interest are distributed measurement systems (DMS). The main topics of this project are methods of network and a wireless DMS designing, allowing the resolving of such hardware and software problems as:

- making the network measurement systems' software independent of hardware platform and allowing it to access the system from any computer with a standard web browser, without the need installation of the dedicated measurement application on the client computer,
- expansion of the measurement systems' application as resulting from the use of wireless communication,
- improvement of DMS reliability resulting from the correction of timing parameters specific to the network and wireless systems.

Scientific aim of this project was to develop a network/wireless DMS' new design and to analyze methods taking advantage of modern wired and wireless communication technologies as well as software technologies. Engineering purpose of this project is to develop software tools and libraries for DMS' software development, which can be used in industry, environment and radiocommunication monitoring as well as in scientific and R&D laboratories.

At the moment, the authors are elaborating the model at the epidemiological level, which allow to identify risk factors associated with such cysts. Knowledge of these factors could be used in the diagnostic model of the disease. Moreover, the general methodology of mathematical modeling in gynecology and obstetrics has been elaborated.

May 24, 2005 – Nov. 23, 2007

Research grant.

The general model of the reconfigurable aperture in the impedance approximation is described in this project. The integral equation for the magnetic currents being excited on a aperture with the variable surface impedance is formulated. A highly effective numerical algorithm is used to obtain the solution of the integral equation. The Genetic Algorithm is used in the optimization of the desired radiation pattern. The optimizer tries to determine the configuration of a conductive pattern on a semiconductor substrate to obtain the desired radiation pattern. The key element of the antenna will be a semiconductor chip that contains a set of individually controlled PIN structures. Electromagnetic waves propagate through the chip, which also serves as a planar dielectric waveguide. The PIN structures locally affect the wave propagation velocity and the antenna can form a beam in practically any direction within a wide steering angle (like a leaky-wave antenna).

The aim of the project was to build and test new experimental procedures for functional assessment of the human auditory cortex (AC). Although functional MR (fMRI) and perfusion methods are well recognized as powerful tools in various clinical and neurological applications, they still suffer from the lack of accurate and repeatable quantitative measures of studied effects. In order to overcome these limitation, the following problems will be studied:

- Design of the new pre-processing algorithms for the removal of physiological noise, motion correction and resolution improvement with shifted measurements. As a result, software will be written in MATLAB (MathWorks, USA) and the algorithms will be tested in fMRI and perfusion studies.
- Design and testing of the novel techniques for generation of fMRI activation maps based on features derived from time-intensity curves in anatomically or functionally defined regions of interest (ROIs). Basing on the measures derived from the time-intensity curves, differences between groups of subjects will be highlighted allowing inference about group separation based on functional responses in chosen regions. Resulting measures can be used for higher level analysis, such as ANOVA, MANOVA etc. in order to show group effects. The new algorithms will be compared with the existing ones and with the gold standard provided by metabolic map-

Krzysztof Zaremba, R. Sulej

Nov. 9, 2006 – May 8, 2008

The aim of this project is to establish the methods of event selection and interaction parameters estimation for the COMPASS experiment. Currently used techniques require manual tuning of the parameters and presumably do not guarantee the highest quality of results. The method of extracting information contained in higher number of parameters and their mutual correlations is needed. Potential solution is the application of the neural network. We propose also the new algorithm for automated control of the network size (constructive network) resistant to the local-minima and over-training problems.

Content-based indexing of medical images: introductory research

The developed ImageShark system consists of 4 main elements: database environment, content-based image retrieval system FIRE with implemented indexes, JPEG 2000 interactive codec for data streaming, web service for distributed searching. Such an approach gives very flexible and effective image retrieval methods. A set of image- and wavelet-domain based indexes were implemented, verified in initial experiments and selected as suitable for mammograms, radiograms, CT exams and other modalities. Reference medical image databases were used in the experiments (DDSM, IRMA, our collected datasets). Precision of data retrieval was comparable with other engines (IRMA, others), giving very promising results with similar or better precision level. To improve retrieval precision, the local features for efficient content-based image retrieval in medical domain were extracted to characterize the images more effectively. The image analysis is limited to a subset of small image regions, where the image information is supposed to be the most important. Beside saving time in the indexing process, these points may lead to a more discriminant index because they are related to the visually or diagnostically most important parts of the image. Local features extraction, done in multi-resolution domain and based on modified salient points' algorithm was proposed. The method tries to find semantically important points in the image which constitute a base for the following steps in the retrieval. These points are selected by inclusion of multi-scale lesion models which classifies and allows the reduction of initial points' set to diagnostically important regions. The experimental comparison to other, state-of-art retrieval effects for medical images is promising for the proposed local image characteristics.

In the first sub-project, new concepts and algorithms have been developed for the design of high-power high-efficiency microwave transistor amplifiers. They have been applied to manufacture telecommunication transmitters of 0.5W power at 410 MHz frequency band, and 1W/5W power at 3.5 GHz. In the second sub-project, numerical methods elaborated by the group have been extended towards the modeling of coupled electromagnetic-thermodynamic problems. The new tools have been applied to the analysis of industrial microwave processing of metal ores and foods, electromagnetic compatibility, EM safety in the

workplace, and MMIC design. The results have been published in international conferences proceedings and journals, and helped enhance international collaboration and industrial links.
