From the Director

Welcome to the 2008 edition of our Annual Report!

Looking back over the past year, I can certainly state that our Institute went through another year of intensive actions and successful initiatives, which were appreciated and lavishly awarded by the national and international worlds of academia and industry. This positive trend of continual effort, growth and advancement on behalf of our employees deserves an even greater acclaim, since we all know how difficult it is to function and succeed in the difficult Polish reality with no clear vision and stable legal and economical situation within the science and education field.

Undoubtedly, the chief asset of the Institute is our outstanding staff. It is their self-motivation, high purpose and great enthusiasm in their approach to all their activities, that guarantee the international renown they cherish. They have, for many years, been the pride and joy of the Institute and being chairs of various world-known organizations and associations or sitting on boards of TPC's of leading international conferences have been spreading its good name all over the world. Therefore, last year, likewise the few previous ones, abounded in our professors receiving numerous national and international awards and prizes for their achievements. First and foremost, one of our research teams received the European most prestigious prize in the field of microwaves for the new original types of reconfigurable antenna. We are all the more proud, as the reception of this highly prestigious prize was a precedent case among the representatives of Central-Eastern Europe academia.

Institute has, for a long time, been known as the leading school of radioelectronics engineers, which is our continual source of joy and satisfaction. Despite the globally visible inflation in the technical education degree, our professional staff still enjoy exceedingly high opinion and interest among the students as well as the representatives of the world academia. As a result, in 2008, many of our lecturers were awarded for their teaching achievements. To mention a few, Marek Rusin, Ph.D., received the Medal of the *National Education Commission* and Jerzy Kołakowski, Ph.D. was awarded *Golden Chalk* distinction for the best lecturer at our Faculty.

The staff of the Institute realized many scientific projects on the bases of the European Framework Programmes. Such projects as CODMUC *Core Subsystem for Delivery of Multi-band Data in CaTV* and ACE *Antenna Centre of Excellence* were completed, and some have been continued, e.g. RESOLUTION *Reconfigurable Systems for Mobile Local Communications and Positioning* and SAFESPOT *Cooperative Systems for Road Safety “Smart Vehicles on Smart Road”* and VISNET *Networked Audiovisual Media Technologies*. Also, the long-term collaboration between the Institute of Radioelectronics and foreign scientific centres, e.g. CERN, has also continually extended our horizons. Recently, the Division of Nuclear and Medical Electronics established the co-operation with one of the Japanese scientific centres and joined the international T2K neutrino experiment.

Beside the realization of many international projects, the Institute was also involved in numerous domestic ones, which were either centrally funded, to mention, in particular, the development grants such as *Multi-antenna Broadband Radiocommunication and Radiolocation Systems* and *Design of High Power Microwave Devices with SiC and GaN Components* or carried out in co-operation with national institutions, e.g. Digital Radio Broadcasting – *Project Tools and Methods, Test Emissions* realized together with the National Institute of Telecommunications. Concurrently,

our employees were running remunerative national and international projects with industrial companies and telecommunication operators. The most successful in the area of domestic ones was Wojciech Wojtasik, Ph.D., who coordinated the project with NETIA S.A. consisting in conversion of bands in point to multipoint systems. All the new developments which have and will come as a result of these initiatives, will contribute to the Institute's image of an indisputable leader in its disciplines.

As a consequence of the projects realization and outcomes, our staff remain active in the publishing field. Throughout 2008, the Institute's teams released publications covering the areas of radiocommunications, multimedia, microwave, acoustics and medical electronics. Our professors were the authors or co-authors of about 200 publications. We are especially content with the fact that our students as well as professionals can extend and update their knowledge basing on the newly published text books and monographs. Our employees also publish frequently referenced papers, are invited with their presentations to the world's leading conferences and research centers, as well as act as reviewers for high-class academic journals.

Conducting advanced research, which additionally results in producing higher number of scientific publications, could not have been possible without a richly equipped laboratory base, which high profile measurement and control aperture is constantly upgraded and expanded, basing on our own resources, grants as well as donations from commercial institutions. *The Foundation for Development of Radiocommunications and Multimedia Technologies* has been playing a major role in this matter in the last decade. The Institute is perceived as the unit which, as one of the last among the technical universities, has preserved its tradition in educating also the hardware engineers. Our strong laboratory base constitutes a vehicle to provide interactive teaching or problem-related research and stimulate participation in various projects as well as attract engineering contracts. It also allows us to vary our educational offer accordingly and organize evening, extra-mural as well as the in-house courses RADEM, which cover a wide choice of subjects of the most in request categories: radiocommunications, multimedia and biomedical engineering.

The Institute of Radioelectronics will not cease in the efforts to drive its targets further on, and will look for new concepts and ideas to take full advantage of its human resources potential. We are also deeply grateful and would like to thank our partners, friends, supporters and sponsors of our activities for their incessant interest and assistance over all those years.

1 GENERAL INFORMATION

1.1 Mission of the Institute

In defining its mission, the Institute of Radioelectronics is amenable to contemporary needs of academia, industry, and society. Therefore, it aims at the three measurable objectives: to provide teaching of societal relevance; to seek excellence in scientific research; and to run projects meeting the international standards. Technically, we focus on the three well-defined specializations: radiocommunications, multimedia, and biomedical engineering. These are very well perceived by our students and partners in national and international activities.

As educators, our staff performs sterling work and exhibit immense stamina. The effects are directly measurable in terms of quality and numbers of supervised diplomas. Our graduates prove competitive on the demanding job market in Poland and abroad. They find employment in telecommunication services, mobile communications, information technology, television, and also in public services. We reach further into these sectors through the successful scheme of continuing education. The offer of courses including Radiocommunications and Multimedia Technologies attracts an increasing number of participants.

As researchers, we are faithful to the highest standards of the Faculty and the University. We also feel quite unique due to an extremely broad spectrum of addressed subjects, which comprise:

- electromagnetic and acoustic field theory, acoustic and electromagnetic wave generation and propagation,
- signal theory, processing, coding, transmission, with regard to electronic, electroacoustic, and TV signals,
- radio transmitting and receiving,
- radiocommunication terrestrial and satellite systems,
- physical phenomena in radio engineering, acoustic, nuclear engineering, and medical systems,
- biomedical signal analysis, medical imaging, medical informatics,
- X-ray, MR, and emission tomography,
- detection and spectrometry of radiation,
- analysis and synthesis of electronic systems,
- intelligent multimedia systems and multimedia converged (video, data, and voice),
- measuring methods and systems,
- analysis, measurement, and estimation of sound and image distortion.

It is also our ambition to implement the new scientific knowledge into a good engineering practice. The Institute covers the full process of technological development, from innovative ideas up to the construction of prototypes. The products are applicable in: radio communication systems, radio-location antennae, television equipment, radio-monitoring systems, high-efficiency energy sources, high-power radio engineering devices, equipment for time and frequency services, biomedical instrumentation, measurement systems involving industry, nuclear engineering for scientific research, medicine, and food industry.

The Foundation for Development of Radiocommunications and Multimedia Technologies plays a special role in perpetuating scientific research within our Institute and the whole Faculty. The Foundation subsidizes undergraduate and graduate scholarships. It monitors and awards the progress of young Polish researchers. Its generous support helps us face the socio-economical obstacles, and compete with commercial opportunities awaiting the young people on the open market.

4 RESEARCH ACTIVITIES

4.1 International projects

4.1.1 European grants

- [Pro1] **Co-operative Systems for Road Safety "Smart Vehicles on Smart Road".**

Tomasz Kosiło, J. Modelska, J. Kołakowski, R. Michnowski, J. Cichocki, P. Makal, Z. Walczak; Jan. 1, 2006 – Dec. 31, 2009

SAFESPORT, EU Integrated Project (Partially funded by MSHE)

The key aspect of the project is to expand the time horizon for acquiring information relevant for safe driving, as well as to improve the precision, the reliability and the quality of the driver information, and to introduce new information sources. The time horizon of the SAFESPORT applications will allow for an extension of the "Safety margin", namely the time in which a potential accident is detected before it can occur, from the range of "milliseconds" up to "seconds". This extension, called "green area", will reduce the risk of the accident to happen as more time will be given to drivers to become aware of a potential danger, and to undertake the appropriate manoeuvres.

- [Pro2] **Reconfigurable Systems for Mobile Local Communications and Positioning.**

Józef Modelska, K. Kurek, Y. Yashchyshyn, R. Szumny, S. Kozłowski, P. Bajurko, A. Cichocki, P. Ślużewski;

Jan. 1, 2006 – Jan. 31, 2009

RESOLUTION, EU Specific Targeted Research Project (Partially funded by MSHE)

The aim of RESOLUTION is developing a wireless 3D local positioning system with high accuracy and real time ability. The system is intended to work in an environment with strong multipath effects and fading, and will be implemented in advanced CMOS technology. Institute of Radioelectronics is responsible for Work Package 3 (antennas and propagation) that considers modelling of the indoor multipath propagation channel and design of smart antenna arrays for the system.

Władysław Skarbek; K. Ignasiak, A. Buchowicz, G. Galiński, K. Kucharski, K. Wnukowicz, M. Tomaszewski, M. Mrogoś, S. Badura, M. Leszczyński; Jul. 1, 2006 – Jun. 30, 2009

VISNET II, EU Network of Excellence (Partially funded by MSHE)

VISNET II builds on the success and achievements of the VISNET network of excellence to continue the progress towards achieving the NoE mission of creating a sustainable world force in Networked Audiovisual (AV) Media Technologies. VISNET II is a network of excellence with a clear vision for integration, research and dissemination plans. The research activities within VISNET II cover 3 major thematic areas related to networked 2D/3D AV systems and home platforms. These are: Video Coding, Audiovisual Media Processing, Audiovisual Media Security and Protection. VISNET II brings together 12 leading European organizations in the field of Networked Audiovisual Media Technologies. The consortium consists of

the organizations known for their proved track record as well as both, national and international reputation in audiovisual information technologies. VISNET II integrates a number of researchers who have made significant contributions to the advancement of this field of technology through standardization activities, international publications, conferences and workshops activities, patents as well as many other prestigious achievements. The 12 integrated organizations represent 7 European states spanning across a major part of Europe, thereby promising the efficient dissemination of resulting technological development and exploitation to larger communities.

but also for evaluation of the nutritional properties of food and beverages, as well as for testing commercial parameters of textiles, construction materials and paper products. Any spectrophotometric analyzer is composed of a spectrophotometric transducer, a source of optical radiation, an output interface and a digital signal processor. During last decade, many miniature spectrophotometric transducers have appeared on the market. Their availability and relatively low prices open the prospects for developing a new class of personal analyzers of food, water, gasoline, atmospheric conditions, etc. The key problems to be solved now are related to the methods and algorithms of spectrophotometric data processing. The project is aimed at the development of the complex methodology for spectrophotometric data processing dedicated to spectrophotometric analyzers, mainly to NIR analyzers of food and beverages.

[Pro13] Acute Ischemic Stroke Detection based on Non-Contrast CT Examinations: Computer-based Methods of Hipodensity Processing, Extraction and Visualization (Detekcja wczesnych udarów niedokrwennych mózgu z wykorzystaniem komputerowych metod przetwarzania, ekstrakcji i wizualizacji informacji z badań anatomicznych TK).

Artur Przelaskowski, U. Fiszer, W. Skarbek, T. Bulski, K. Sklinda, M. Kazubek;

May 10, 2007 – Sept. 30, 2009

Ischemic stroke is the clinical syndrome of rapid onset of focal, or sometimes global, cerebral deficit with a vascular cause, lasting more than 24 hours or leading to death. Infarction may occur in any area of the brain following vascular territory or watershed distribution. Brain imaging is required to guide the selection of acute interventions to treat patients with a stroke, which is very important for the stroke emergency centers. The recent advent of thrombolytic therapy for acute stroke treatment makes as early as possible detection of areas of hypoattenuating ischemic parenchyma exceedingly important. For most cases, CT remains the most important brain imaging test. The most frequent and reliable signs of irreversible ischemic injury is a focal hypodense area (i.e. with density lower than normal brain tissues), in cortical, subcortical, or deep gray or white matter. However, on the initial CT-scan, performed during the hyperacute phase of stroke (0-6 h), the subtle hypodensity does not have to be seen because of artifacts, noise and other tissue abnormalities.

The purpose of our study is to improve the diagnosis of hyperacute ischemic brain parenchyma on emergency CT scans. The method is the enhanced visibility of more distinguished or extracted subtle and hidden hypodense signs. Multi-scale hypodensity modeling was based on the following data processing stages: the initial gray-to-white tissue segmentation; the next segmentation of potentially hypodense areas (e.g. sulci or the aged lesions); noise suppression in selected ROIs through the non-perfect signal reconstruction in successive scales, basing on middle band noise suppressing, adaptive signal modeling and extraction. Local contrast of the processed images was additionally improved by adaptive data visualization methods. Realized concept of Stroke Monitor is a display of ischemic stroke as a kind of computer aided interpretation tool. Signal and noise separation based on spatially distributed properties over different scales and sub-bands is

optimized. Lower frequency parts offer distinguished information about poor textures and mean value estimates in regions. A correlation of high frequency information across scales, portrays even very weak edges and region distinction. Therefore, noise and artifacts may effectively be reduced in multi-scale data processing. Post-processing in multi-scale domain (wavelets, curvelets) is less susceptible to local perturbations, and beneficial noise suppression and selective contrast enhancement is possible.

Tadeusz Morawski, D. Gryglewski, W. Wojtasiak, M. Lubiejewski;
Nov. 7, 2007 – Nov. 6, 2010
Commissioned Research Project

The main aim of the project is the realization of universal T/R modules for X-band providing control over such parameters as: pulse duration, pulse delay with respect to the triggering signal, tunable operation point for transistors in power amplifiers. T/R modules are applicable for radiolocation systems of both the older (e.g. with electronic beam steering) and the newer generation, in which experiments with the new shape of pulse will be possible, thanks to the SDR (software defined radio) idea. The most basic problem during the designing process of the device is related to the design of the high power amplifier, precisely (in the present case) with GaAs FET transistors, thermal delays of duration (very short) comparable with a radiolocation pulse. The project consist of several tasks, the main of which is to design and realize a universal T/R module. Other tasks concern: the optimization of receiving input circuits with respect to noise level and durability, making power supply and control block universal for SDR application. Completing these tasks is going to allow for the compilation of general methodology to construct modern devices for professional radiolocation.

The aim of this project is to establish the methods of event selection and interaction parameters estimation for the COMPASS experiment. Currently used techniques require manual tuning of the parameters and presumably do not guarantee the highest quality of results. The first aim of the work was to verify whether the design of the concert hall based on the suggested values of acoustic parameters known from literature will bear fruit in a satisfactory quality of sound. The aim of the optimisation was to achieve the preferred values of the acoustic parameters. As a result, two models were constructed – one with classical rectangular and another one with fan-shape audience. The second subject was to project and develop the model of a two-channel acoustic amplifier. The work includes also computer simulations and objective measurements of device's parameters, which were conducted using proper measurement equipment. There are also presented results of sound quality assessment obtained from the group of listeners. The last topic concerned building of a real time digital range controller which can be used in the radio and television recording and broadcasting studios. The main purpose of such system is to increase or decrease the dynamic range of an audio signal in a prescribed way without introducing suggested distortion. The results of both objective and subjective tests were shown.

Analysis of measurement uncertainty in tissue blood content examination by means of optical technique

The aim of the work was to do an analysis of measurement uncertainty in tissue blood content by means of optical technique. The computer program was prepared for Monte Carlo simulation of photon migration in turbid tissue. A multi-channel device for tissue blood content measurement was elaborated.

Medical images perception improvement with the use of bilinear filtering

A new method of the contrast improvement of medical images was investigated. This method is based on the sequence of two operations: in a first stage a bilinear filtering is used for noise elimination, next a method of contrast modification will be applied. The bilateral filter takes both, geometric closeness and photometric (gray scale) similarity of neighboring pixels into account. We used fast bilateral filter elaborated by Paris and Duran. We observed that the width of Gaussian function determining the influ-

ence of the gray scale difference will increase when the window width on the Dicom viewer decreases.

Integrated workstation for image-based medical diagnosis

Radiology is extremely susceptible to computer-based integrated support in decision-making. Integration of databases, decision-aiding tools (e.g. computer-aided diagnosis - CAD), systems, networks can help to determine what information is needed that a user does not have. All necessary and useful information should be integrated and easily accessed with Radiology Information system (RIS). Decision support tools will provide more information to end-users, but need to be more fully integrated into the PACS (picture archiving & communication systems) database. The integration is essential for improved diagnostic data evaluation, decision making and finally high-quality patient care.

The purpose of our research was the completeness of supplied computer aid to improve the diagnosis. However, visualization and navigation of all accessible medical information requires efficient selection of all the information necessary to make effective clinical decisions without distracting the user, followed by information synthesis. Automation by integration can improve database information quality, as well as facilitate improved user interfaces, computer-aided tools, and preemptive detection of errors before they propagate. The importance of provided information quality, CAD-based support and tele-radiology, flexible adjustment to various needs, and easily accessible examples of pathology cases, quick and precise retrieval (e.g. with content-base indexing & retrieval - CBIR), are crucial

- PACS/RIS/telediagnosis integration,
- integrated user interfaces of every accessible information sources, systems and tools,
- diagnostic workstation integration

PhD thesis, 19 published papers and experimental verification of integrated diagnosis interfaces, technologies and data access points confirmed the usefulness of designed diagnosis environment.

Electrical tomography techniques applied in medicine and industry

In the current year, the works on the volume tomograph have been focused on refining and starting the new version of Electrical Capacitance Tomograph (ECT) for investigation of the two-phase flow structure as gas-solid, gas-liquid, liquid1(water)-liquid2(oil).

To obtain the complex parameters of the flow usually ECT is used in the correlation method. Implementation of the cross-correlation function need two plane tomography sensors with d distance between them, placed on the pipe surface.

[Pro25] **UWB Transmitters for Localization System** (Ultraświerokopasmowe układy nadawcze do systemów lokalizacyjnych).

Jacek Cichocki, J. Kołakowski, R. Michnowski, K. Radecki, W. Kiełek (em.), S. Żmudzin, P. Makal, P. Ziętek;

Aug. 1, 2007 – Nov. 28, 2008

The project covered two investigation areas: generation technique of UWB (Ultra-Wide Band) signals, and design and realization of UWB transmitters. Generally, there are two commonly used techniques of generating signal - by means of signal pulse filtering and the second method - signal pulse up-conversion (mixing). Base on the performed investigation the UWB transmitters intended for localization system were designed and developed. The first circuit works on S band, and consist of pulse amplifier controlled by LVDS receiver, afterwards SRD diode and band-pass filter which form the shape of the UWB signal. The circuit is triggered from control module (CPLD). The second one works on C band, and consists of the comparator which compare reference signal with formed input signal, low pass filter, mixer and VCO generator.

[Pro26] **Applications of Switch-mode Controllable Voltage Regulators in High-power Amplitude Modulators** (Zastosowanie impulsowych zasilaczy sterowanych w układach modulatorów amplitudy o dużej mocy wyjściowej).

Juliusz Modzelewski, W. Kazubski, M. Mikołajewski, H. Chaciński;

Aug. 1, 2007 – Nov. 28, 2008

The project concerns the high-efficiency switched-mode supply unit controlled by the external audio signal (50Hz – 4.5kHz), destined for high-power amplitude modulators of HF carrier in radio AM transmitters. This supply unit is based on the buck DC-DC converter in which the modulating audio signal is summed with the DC reference voltage. Due to high-gain feedback loop the output voltage is proportional to the instantaneous value of the resultant reference voltage. The stability of the controllable supply unit and the wide band of modulating audio signals have been obtained by the lag-lead compensation of frequency characteristics of the feedback loop. The experimental medium-power controllable buck converter ($V_{Omax} = 20V$, $i_{Omax} = 2A$) with the typical IC controller of DC/DC converter (UC1225A) was built and tested. The measured parameters of this converter are satisfactory (full-power band 5.3kHz, THD<3%, efficiency 86-91%).

The aim of the project was to learn about hyper-polarization process of some nuclei used in magnetic resonance imaging technique (MRI). A typical MRI image shows spatial concentration of hydrogen nuclei bounded in water molecules. Other nuclei like: ^3He , ^{129}Xe , ^{13}C can be also imaged, but due to either small natural abundance or density they require special preparation. One of possible solutions is so called hyperpolarization. It uses microwave radiation or circularly polarized laser light in order to build-up electronic polarization, which thereafter can be transferred to nuclear polarization with spin-spin exchange process.

[Pro35] **The Evaluation of the Selected Predictive Algorithms Controlling Insulin Dosing in Diabetic Patients** (Badanie wybranych algorytmów regulacji predykcyjnej w dawkowaniu insuliny u chorych na cukrzycę).

Dariusz Radomski, A. Przelaskowski, M. Ławryńczuk, P. Marusak, P. Tatjewski;

Apr. 25, 2008 - Dec. 31, 2008

The aim of the research is to elaborate the computationally efficient predictive control approaches to stabilization of the blood glucose concentration in patients suffering from diabetes type 1. These algorithms are based on the introduced neural and fuzzy models which approximate a nonlinear dynamic of an insulin-glucose relationship. The proposed control methods offer much better control performance than the algorithms based on linear models. Moreover, their closed-loop accuracy is similar to that obtained in predictive control algorithms with full nonlinear optimization repeated on-line. Although simple, such algorithms offer advantages resulting from its prediction capabilities.

[Pro36] **Security of Distributed Measurement and Control Systems with Asymmetric Computational Resources** (Bezpieczeństwo sieci typu RSPS o asymetrycznych zasobach obliczeniowych).

Tomasz Adamski, W. Winiecki, R. Łukaszewski, P. Bobiński, T. Owczarek, P. Bilski, J. Olszyna;

Apr. 25, 2008 - Dec. 31, 2008

The grant deals with information security of DMCS (Distributed Measurement and Control Systems). The specific properties of DMCS like asymmetric structure of computational resources of hosts (i.e. asymmetry of computational power, asymmetry of memory capacity and asymmetry of power supply) lead to the necessity of applying special algorithmic and hardware solutions well suited DMCS networks. To assure information security in such specific networks we have proposed special carefully chosen methods, algorithms and circuits. Special attention was paid to low power solutions (low complexity cryptographic

algorithms and dedicated circuits). The main results of the grant are the following:

- low power cryptographic software and hardware solutions for secured DMCS networks (Barrett algorithm, Montgomery algorithm, small exponent algorithms implemented in parallel and systolic structures);
- methodology how to use multi-core processors to secure DMCS with some specific examples (like AES implementation);
- assessment of security level in quantum cryptography systems applied to DMCS (probabilistic properties of protocols);
- Large Numbers Library for Lab View and Lab Windows (set of primitives, basic procedures) which are building blocks of cryptographic systems (in particular public key cryptosystems). Secure DMCS networks can be designed using developed Large Numbers Library.

[Pro37] **Transductive Classifiers Optimization by Means of Cross-Estimation Tests and Application in Cardiology and Bioinformatics** (Optymalizacja klasyfikatorów transdukcyjnych na podstawie testów oceny krzyżowej i zastosowania w kardiologii i bioinformatyce).

Ewa Piątkowska-Janko, S. Jankowski, A. Oręziak, 30h/sem.; semestr L. Wyrwicz, Z. Szymański, J. Będkowski, P. Danielewicz, T. Rubel;

Apr. 25, 2008 - Dec. 31, 2008

A new learning classifier is presented in the form of transductive least squares support vector machine – TLS-SVM. The transductive inference is based on the influential statistics of data set, i.e. by applying the virtual leave-one-out score. In the considered system this test can be expressed as the analytic formula, hence it is numerically efficient. The presented learning classifier was successfully applied to computer-aided medical diagnosis: signal-averaged electrocardiograms (SAECG) selected and commented by cardiologists of the Warsaw University of Medicine.
